

**CLIMATE &
CLEAN AIR
COALITION**

TO REDUCE SHORT-LIVED
CLIMATE POLLUTANTS

Estimating emissions of Black Carbon and other SLCFs within CCAC activities

V. Foltescu, Z. Klimont, H. Vallack

IPCC Expert Meeting on SLCF, Geneva, May, 2018

Maximising Air & Climate Co-Benefits

ANNUAL BENEFITS

From large-scale mitigation by 2030

CLIMATE

AVOIDED WARMING

REDUCED RATE OF SEA-LEVEL RISE BY -20% BY 2050

HEALTH

2.4 MILLION

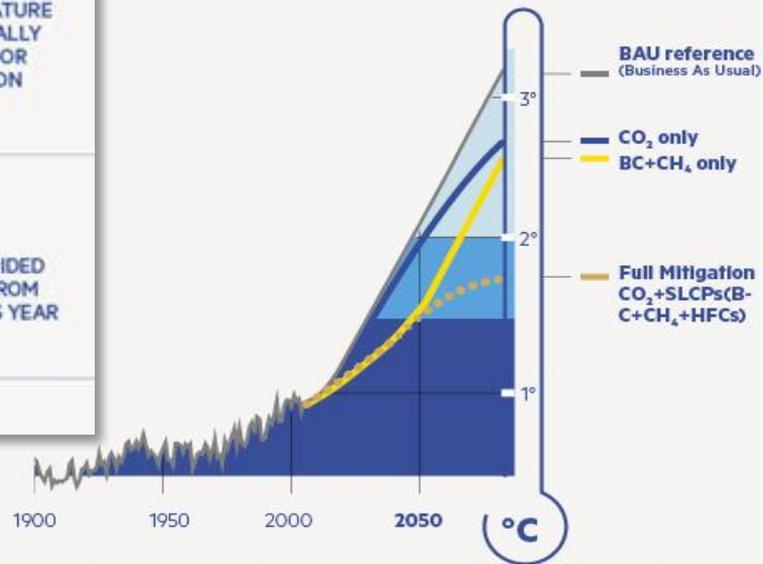

AVOIDED PREMATURE DEATHS ANNUALLY FROM OUTDOOR AIR POLLUTION

CROPS

52 MILLION

TONNES OF AVOIDED CROP LOSSES FROM 4 MAJOR STAPLES YEAR

SIMULATED TEMPERATURE CHANGE UNDER VARIOUS MITIGATION SCENARIOS

SHORT-LIVED CLIMATE POLLUTANTS

Near term response to mitigation

SUBSTANCE	ANTHROPOGENIC SOURCES	LIFETIME IN ATMOSPHERE	LOCAL REGIONAL GLOBAL
BLACK CARBON (BC)		DAYS	 
METHANE (CH ₄)		12 YEARS	 
TROPOSPHERIC OZONE (O ₃)		WEEKS	 
HYDROFLUORO-CARBONS (HFCs)		15 YEARS (WEIGHTED BY USAGE)	 

Need for comprehensive and harmonized methods to estimate SLCF emissions

BENEFITS

Authoritative guidance that includes the additional SLCF would improve:

- Integration and the internal consistency between GHGs emission inventories and non-GHGs emission inventories, within and across the various assessments (including IPCC's)
- Comparability in terms of the emissions inputs into the various climate models used to inform policies
- Consistency of climate mitigation strategies at global to local levels, and across sectors
- Consistency in providing uncertainty estimates for calculating emissions relevant to mitigation of climate change and air pollution
- Ability to monitor and evaluate progress in reducing emissions of those SLCFs not covered by the Kyoto or Montreal Protocols

Need for comprehensive and harmonized methods to estimate SLCF emissions

BENEFITS (cont)

Authoritative guidance on SLCF would improve:

- Ability to more reliably estimate wider benefits (health, food security, etc) by a harmonized approach for all emissions leading to formation of particulate matter and ozone
- Ability of countries to estimate emissions of black carbon and co-emitted substances according to authoritative global methodology and include black carbon emission reduction measures in the NDCs
- Transparency of national estimates, including potential future updates and recalculations based on revised/updated guidelines
- Ability for countries to include e.g. health benefits and food security along with other benefits supporting the SDGs

Impact assessment of all emissions

Estimating emissions

$$\text{Emission} = \text{Activity rate} \times \text{Emission factor}$$

Data for level of activity (Activity rate)

The screenshot shows the LEAP software interface. On the left is a navigation pane with icons for Analysis, Results, Diagram, and Energy Balance. The main area displays a tree view of activity levels under 'Manufacturing and Construction'. The 'Traditional kilns' item is selected and highlighted in blue. To the right, a data table is displayed with columns for Branch, Expression, Scale, Units, and Per. The table contains two rows: 'Brick Kilns' with an expression of '20', a scale of 'Million', units of 'Bricks', and 'Per' is blank; and 'Traditional kilns' with an expression of 'Remainder', a scale of 'Percent', units of 'Share', and 'Per' is 'of Bricks'. At the bottom of the table, there are buttons for 'Expression OK' and 'Check as You Type'.

Branch	Expression	Scale	Units	Per
Brick Kilns	20	Million	Bricks	
Traditional kilns	Remainder	Percent	Share	of Bricks

Estimating emissions: Emission factors

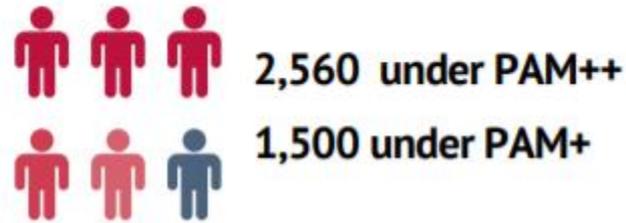

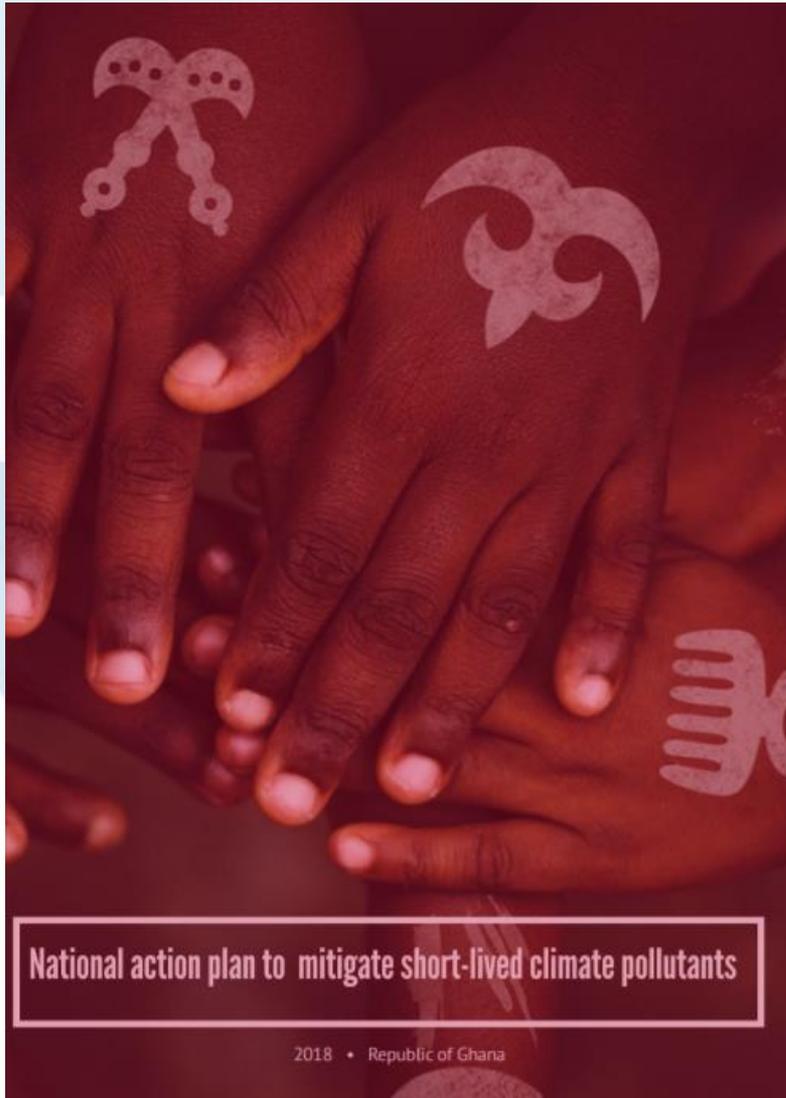

- Residential
 - Cooking
 - Natural Gas
 - Kerosene
 - LPG
 - Traditional Stove Charcoal
 - Traditional Stove Wood
 - Carbon Dioxide Biogenic
 - Carbon Monoxide
 - Methane
 - Non Methane Volatile Organic Comp
 - Nitrogen Oxides
 - Nitrous Oxide
 - Sulfur Dioxide
 - Particulates PM10
 - Particulates PM2p5
 - Black Carbon
 - Organic Carbon
 - Ammonia
 - Traditional Stove Vegetal Wastes
 - Improved Biomass Stove with Chimney
 - Traditonal Stove Animal Wastes
 - Fan Assisted Biomass Stove
 - Electricity
 - Lighting
 - Other

Branch	Expression	Units	Per
Carbon Dioxide Biogenic	112 ?a	Metric Tonne	Terajoule
Carbon Monoxide	4260 ?b	Kilogramme	Terajoule
Methane	300 ?a	Kilogramme	Terajoule
Non Methane Volatile	600 ?c	Kilogramme	Terajoule
Nitrogen Oxides	73 ?b	Kilogramme	Terajoule
Nitrous Oxide	4 ?a	Kilogramme	Terajoule
Sulfur Dioxide	SulfurCont	Kilogramme	Kilogramme
Particulates PM10	10.2 ?e	Kilogramme	Metric Tonne
Particulates PM2p5	8.16 ?f	Kilogramme	Metric Tonne
Black Carbon	1.12 ?f	Kilogramme	Metric Tonne

Notes on Branch: Demand\Residential\Cooking\Traditional Stove Wood

a) IPCC 2006 Guidelines - Tier 1 default EFs
 b) Zhang et al. (2000) Average EF for household stoves in China.
 c) EMEP/EEA (2013) Tier 1 emission factor
 d) Bond et al. 2004 (Table 6)
 e) Assume PM2.5 = 80% of PM10 as reported for wood and crop waste by Rec
 f) GAINS ECLIPSE EFs from Klimont et al (2016) Table S2.3

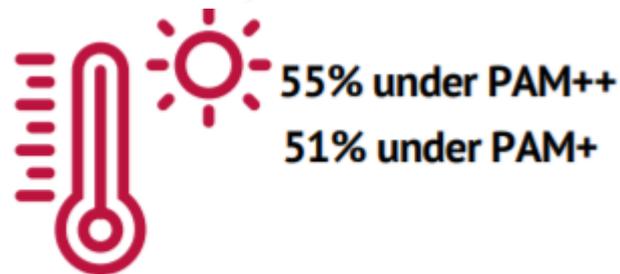

Application of LEAP-IBC results in national planning (from Ghana national SLCP plan: benefits by 2040)

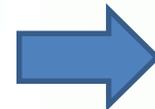

Avoided deaths

Reduction in crop loss

Temperature response

Actions to implement priority measures

Preliminary results, Daniel Benefor, Ghana EPA

Black carbon emissions from Ghana under different scenarios (from draft national plan)

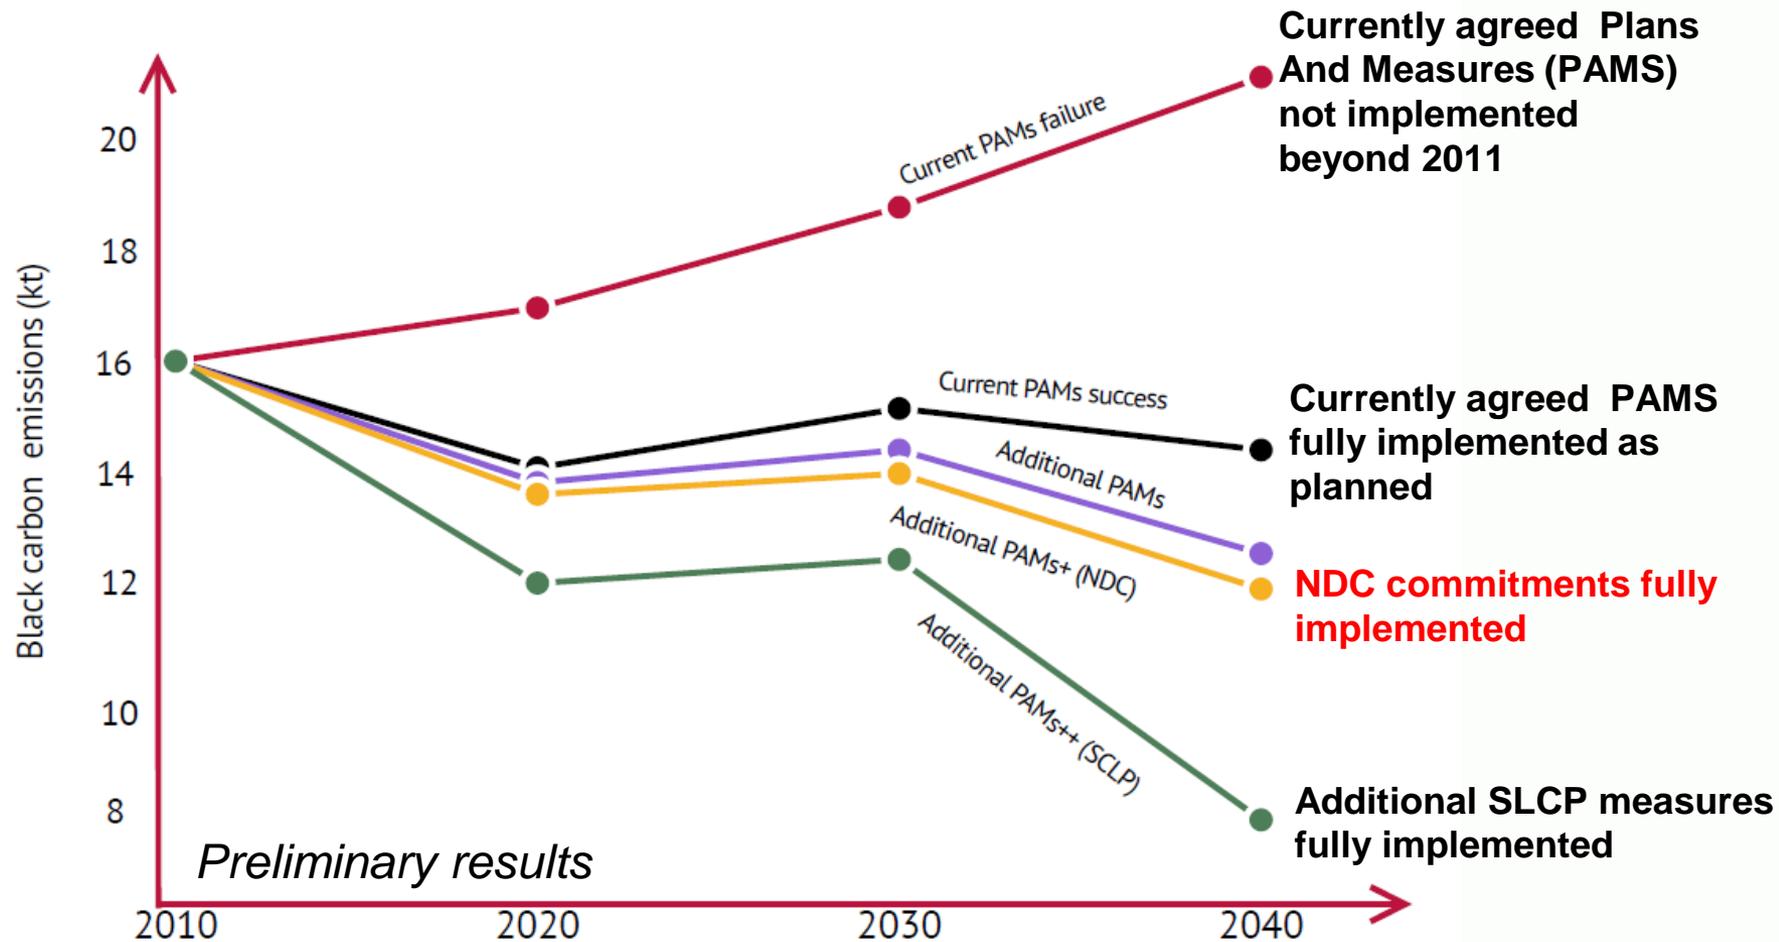

Fig 7 - Black carbon emission trajectories for five SLCP mitigation policy option

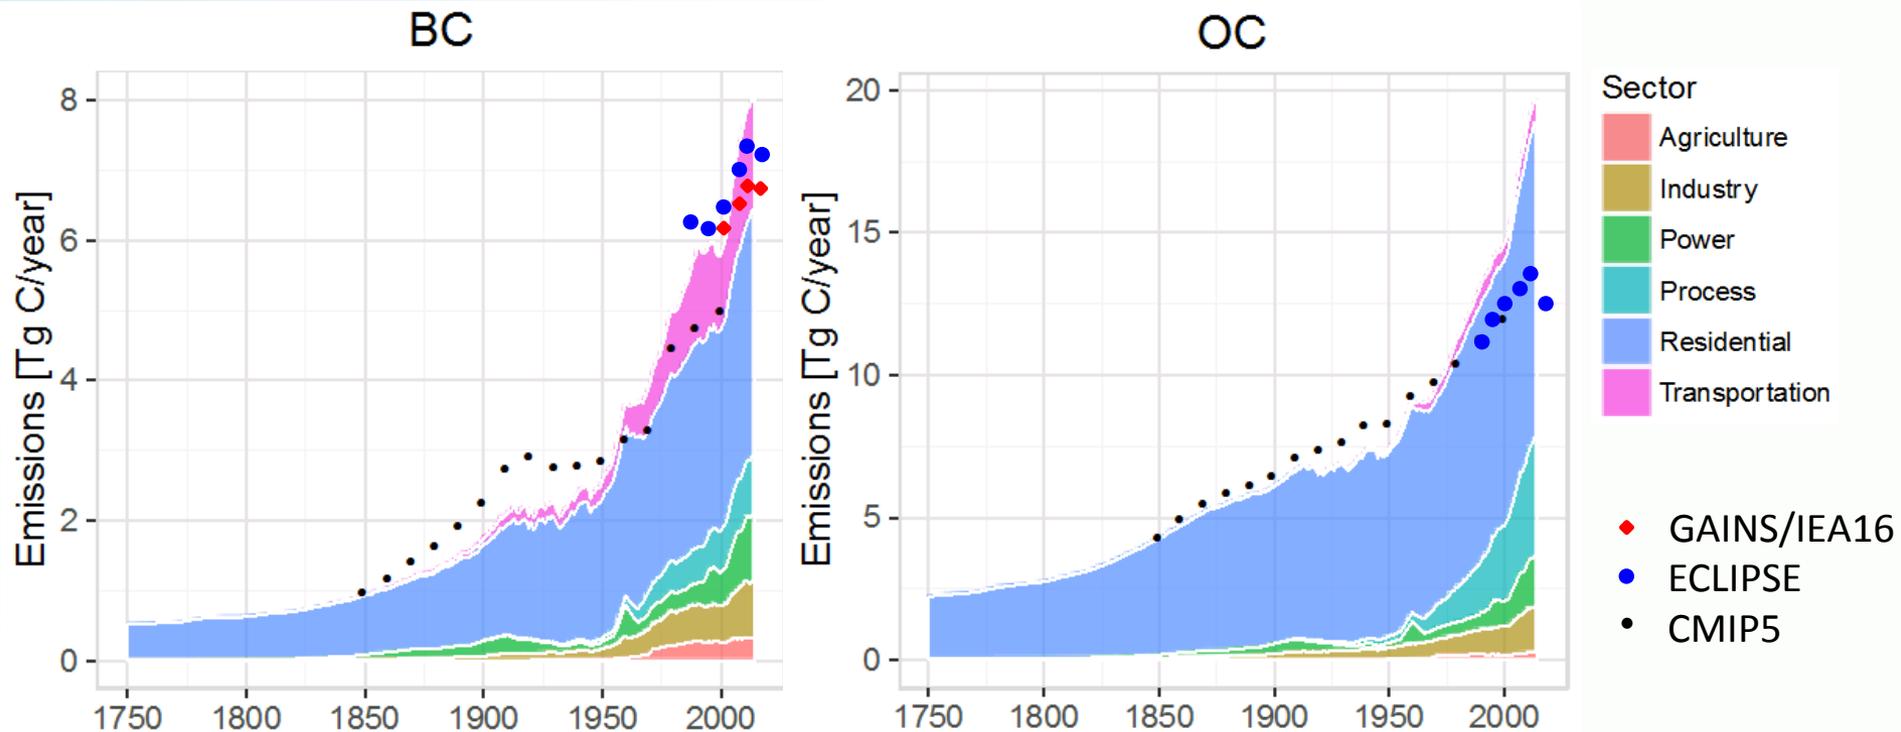

The national SLCP plan covers: success of current PAMS; success of implementing NDC commitments; promotion and implementation of additional SLCP measures

Summary

- ❖ LEAP-IBC enables the estimation of emissions of BC (and co-emitted substances) - appropriate for countries in Asia, Africa and Latin America.
- ❖ The tool uses official sources (EMEP/EEA and IPCC) for default EFs where relevant, supplemented by factors from peer-reviewed literature.
- ❖ Within the SNAP initiative, 12 countries currently using LEAP-IBC to compile BC inventories and 18 more in the pipeline

Global estimates for CMIP5, CMIP6, ECLIPSE, GAINS/IEA16

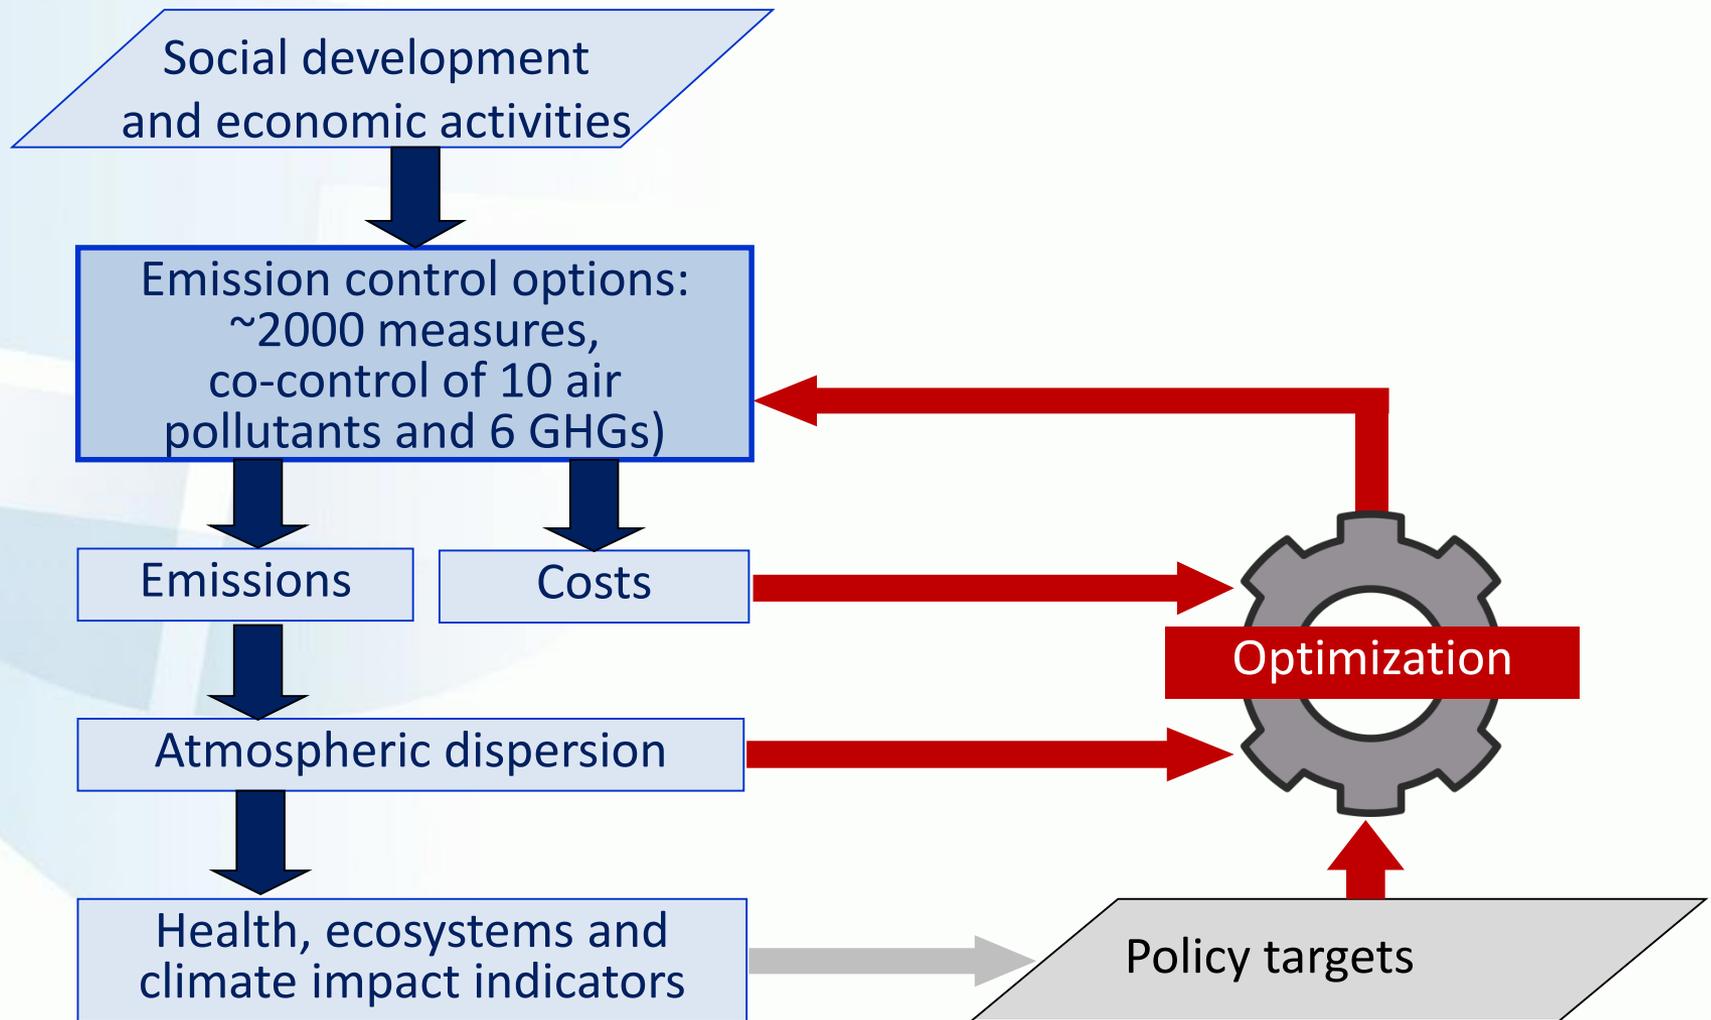

CMIP6 - Hoesly et al. (2017) Community Emission Data Systems paper

CMIP5 - Lamarque et al. (2010, JGR)

ECLIPSE - Klimont et al. (2017, ACP)

GAINS/IEA16 – IEA (2016) Special Report on Air Pollution

Greenhouse gas–Air pollution Interactions and Synergies (GAINS)

Emission estimation method

- How....principally, *Emission=Activity*emission factors* but explicit incorporation of technology (j, m) in activity (A) and emission factor (ef), considering impact across all included pollutants (y), control measure efficiency (eff) and its application rate (X)

$$\begin{aligned} E_{i,y} &= \sum_{j,k,m} E_{i,j,k,m,y} \\ &= \sum_{j,k,m} A_{i,j,k} ef_{i,j,k,y} (1 - eff_{m,y}) X_{i,j,k,m} \end{aligned}$$

For carbonaceous species considering also BC,OC, PM balance:

$$ef_{OC} = (ef_{PM_{2.5}} \times f_{carb} - ef_{BC}) \div f_{OM}$$

- *Pollutants...*SO₂, NO_x, NMVOC, CO, NH₃, PM (size fractions), BC, OC, and Kyoto GHG;
- *Sources...*~ 2000 sector-fuel-technology combinations; anthropogenic only

LRTAP vs GAINS for EU28;

Sectoral differences

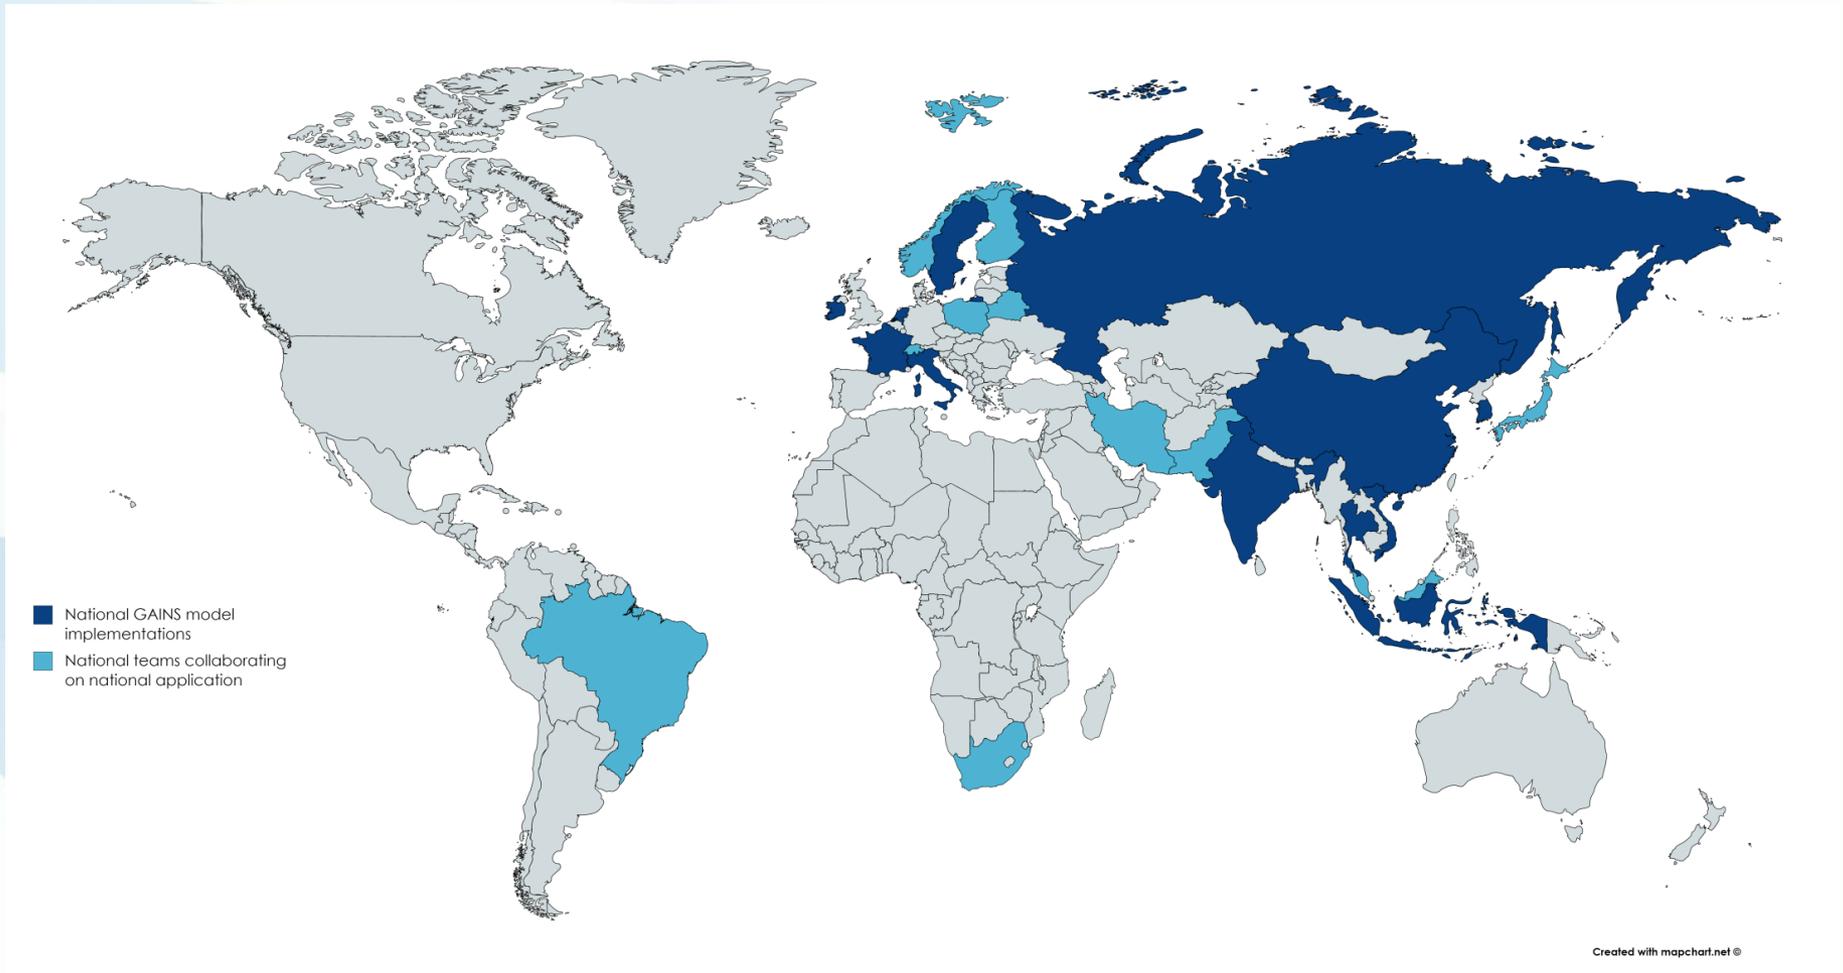

BC emission comparison, LRTAP vs GAINS

Nordic countries

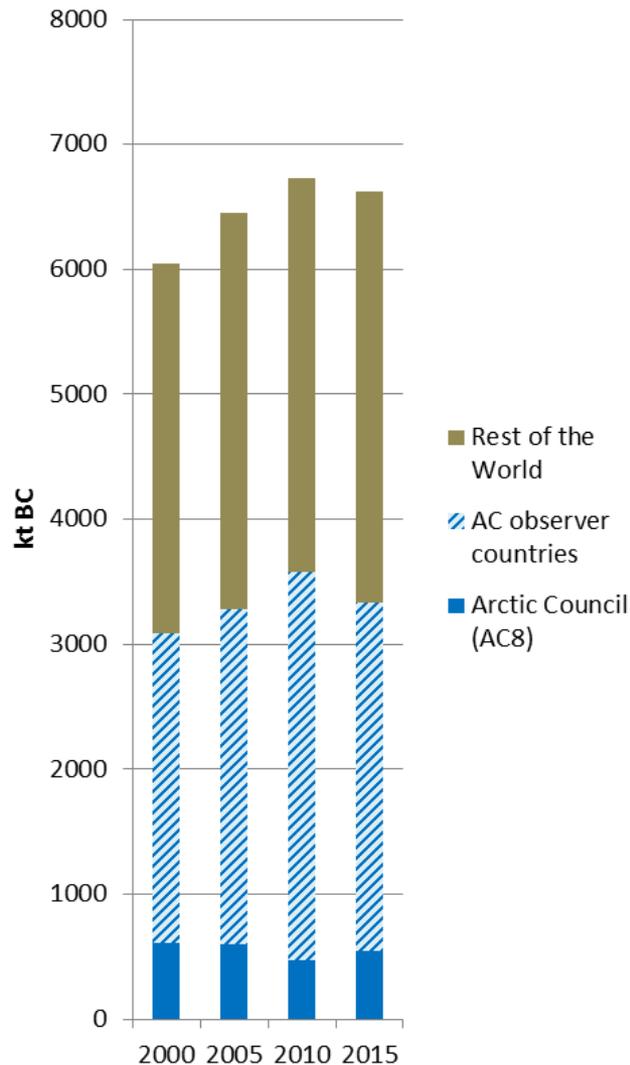

GAINS model has been also applied and further developed at the national level

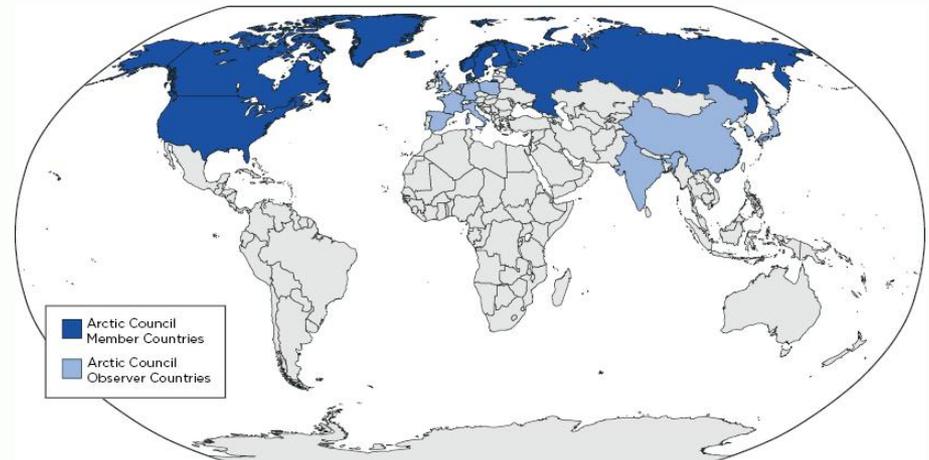

GAINS also applied in several regional and global research activities: e.g., EU funded (ACCENT, CityZen, ECLIPSE), IEA, UNEP/CCAC, GEA, RCP8.5, EMF, SSPs

New EU funded activity (started 2018) addressing BC knowledge gaps and policy support focusing on Arctic Council and observer countries

- While **AC8 contribute less than 10%** of global BC emissions, **about 50% originates from AC8 and observer countries**

Map source: http://www.nap.edu/catalog.php?record_id=21717

- **Good platform for further discussion:** IIASA-GAINS model has been applied in bilateral projects with most of the observer countries in Asia and Europe

Need for comprehensive and harmonized methods to estimate SLCF emissions

WHY?

- There is a large expressed demand from non-UNECE countries to develop emission inventories for additional SLCFs beyond those covered by the Kyoto or Montreal Protocols.
- A comprehensive methodology and a database of default emission factors for the additional SLCFs for all sectors, that has global coverage, with regional differentiation where appropriate, is currently lacking.
- A large pool of data and information on emissions is already available. It can be scrutinized, bundled and incorporated into a comprehensive emission inventory guidance.
- There is valuable experience in using existing UNECE-LRTAP black carbon guidelines that can serve the development of globally applicable guidelines for black carbon and co-emissions.
- Climate analyses such as those underlying IPCC Assessments or UNEP Gap Reports include all SLCFs but only as ‘expert judgments’

Additional slides

Key data sources and assumptions in GAINS model and scenarios

- **Methodology**
 - Principles of the GAINS model: Amann et al., 2011
 - PM, BC methodology: Klimont *et al.* (2002, 2017), Klimont and Kupiainen (2004, 2007)
 - Technical details in a number of earlier reports and papers available from <http://gains.iiasa.ac.at>
- **Activity data**
 - Energy: IEA World Energy Outlook (global); EUROSTAT and PRIMES model (EU); national experts inputs
 - Agriculture: FAO (global); EUROSTAT, EFMA, and CAPRI model (EU)
- **Legislation (regular updates)**
 - Published information about existing and committed emission limit values and reductions, e.g, diesel.net, CAI-Asia, EU Directives, etc.
- **Emission factors (regular updates)**
 - Peer reviewed papers, guidebooks, grey literature - documented in interim reports available from GAINS web, most values accessible from GAINS-online model

GAINS applications

- **Europe** (UNECE LRTAP, NEC Directive, CAFE program)
- **Asia** (GAINS-Asia, UNEP/CCAC)
- **Annex I** (primarily GHG)
- **Arctic** (Arctic Council Task Force on SLCF; focus on BC and CH₄)
- **Italy, Netherlands, France, Sweden, Ireland, China, India, Thailand, Korea, Indonesia, Iran, Vietnam** (bilateral projects)
- and **global** (ACCENT, IEA, UNEP, GEA, CityZen, ECLIPSE, RCP8.5, EMF, SSPs)

Arctic countries produce reports on SLCP emissions

Reference method for emission factors is EMEP/EEE Guidebook
