(Quote from McCollum et al., in review)

Behavioural response	Road Traffic Accidents (3.4/3.6)
	Active travel modes' (such as walking and cycling) represent strategies not only for
	boosting energy efficiency but also, potentially, for improving health and well-being
	(e.g., lowering rates of diabetes, obesity, heart disease, dementia, and some cancers).
	However, a risk associated with these measures is that they could increase rates of
	road traffic accidents, if the provided infrastructure is unsatisfactory. Overall health
	effects will depend on the severity of the injuries sustained from these potential
	accidents relative to the health benefits accruing from increased exercise. (Quote from
	McCollum et al., in review)
	McCollum et al. (in review); Creutzig et al. (2012); Haines and Dora (2012); Saunders et
	al. (2013); Shaw et al. (2014); Woodcock et al. (2009), Shaw et al (2017),Chakrabarti
	and Shin (2017), Hunag et al (2017)
Accelerating energy	Reduce illnesses from hazardous air, water and soil pollution (3.9)
efficiency improvement	
	Locally relevant policies targetting traffic reductions and ambitious diffusion of electric
	vehicles results in measured changes in non-climatic population exposure included
	ambient air pollution, physical activity, and noise. The transition to low-carbon
	equitable and sustainable transport can be fostered by numerous short- and medium-
	term strategies that would benefit energy security, health, productivity, and
	sustainability. Evidence-based approach that takes into account greenhouse gas
	emissions, ambient air pollutants, economic factors (affordability, cost optimisation), social factors (poverty alleviations, public health benefits), and political acceptability is
	social ractios (poverty alevations, public headin benefits), and political acceptability is needed tack these challenges.
	(Schucht et al., 2015);/figueroa, Lah, Fulton, McKinnon, & Tiwari, 2014);(Peng, Yang,
	Wagners, & Maugerall, 2017; (Kausbruckner et al., 2016)
Improved access & fuel	End Poverty in all its forms everywhere (1,1,1,4,1,a, 1,b) Ensure Access to Food Security (2,1, 2,3, 2, a, 2,b,2,c) Reduce illnesses from hazardous air pollution (3,9)
switch to modern low-	
carbon energy	Climate change threatens to worsen poverty, therefor pro-poor mitigation policies are 21 Projects aiming at resilient transport infrastructure development to improve access Projects aiming at resilient transport infrastructure development (e.g. C40 Cities Clean
	needed to reduce this threat; for example investing more and better in infrastructure (e.g. C40 Cities Clean Bus Declaration, UITP Declaration, OIF Bus Declaration, UITP Declaration on Climate Leadership, Cycling Bus Declaration on Climate Leadership, Cycling Delivers on the Global
	by leveraging private resources and using designs that account for future climate Delivers on the Global Goals, Global Sidewalk Challenge) do not substantially contribute Goals, Global Sidewalk Challenge) are targetting at reducing airpollution, Electric
	change and the related uncertainty. Communities in poor areas cope with and adapt to to realizing the (indirect) transport targets with mostly a rural focus: Agricultural vehicles using electricity from renewables or low carbon sources combined with e-
	multiple-stressors including climate change. Coping strategies provide short-term relief Productivity (SDG 2) and Access to Safe Drinking Water (SDG 6) mobility options such as trolleybuses, metros, trams and electro buses, as well as
	but in the long-term may negatively affect development goals. And responses generate promote walking and biking, especially for short distances need consieration
	a trade-off between adaptation, mitigation and development. African cities with slums
	and due to high commuting costs many walk to work places which limit access. In Latin
	america tripple informality leading to low productivity and living standards. In Sweden
	decarbonisation of public bus is receiving attention more than efficiency improvment.
	With more electrification electricity price goes up and affordibility can worsen for poor
	unless redistributive policies are in place.

Lechtenböhmer, M. Åhman, L.J. Nilsson, E. Worrell, L. Coenen (2017) Responsible and sustainable consumption		
		[+2] CARACTER CONTRACTOR CONTRAC	[+2] CICIC 696 ★★★★ Technological improvements alone are not sufficient to increase energy savings: Zhao et al. (2017) findings indicate that building technology and occupant behaviors interact with each other and finally affect energy consumption from home. They found that occupant habits could not take advantage of more than 50 percent of energy efficiency potential allowed by an efficient building. In the electronic segment product obsolescence represents a key challenge for sustainability. Echegaray (2015) discusses the dissonance between consumers' product durability experience, orientations to replace devices before terminal technical failure, and perceptions of industry responsibility and performance. The results from their urban samples urvey indicate that technical failure is far surpassed by subjective obsolescence era a cause for fast product replacement. At the same time Liu, Oostrwer, and Spaargaren (2017) suggest that we need to go beyond individualist and structuralist perspectives to analyse sustainable consumption (i.e. combines both human agency paradigm and social structural perspective).

	Decarbonisation/CCS/CCU	Affected by and exception bits are services	(2017), Liu et al (2014), Stahel (2017)	(2017), Liu et al (2014), Stahel (2017) Innovation and new infrastrcutture (9.2,9.4,9.5)
	Decarbonisation/CS/CU	Affordable and sustainable energy sources [12,-2] CLD OB ★★ CCS for EPIs can be incremental but needs additional space and can need additional energy sometimes compensating for higher efficiency otherwise, Recirculating Blast R Furnace & CCS for ion steel means high energy demand, electric melting in glass can mean higher electricity prices, in paper industry new separation and drying technologies are key to reduce the energy intensity, allowing for carbon neutral operation in the future, bio refineries can reduce petrorefineries, DBI in iron and steel with H2 encourages innovation in hydrogen, biobased polymers can increase bioma price. Wesseling, J.H., S. Lechtenböhmer, M. Ahman, LJ. Nilsson, E. Worrell, L. Coenen (2017)	Progressively decouple growth from env degradation (8.1, 8.2, 8.4) [+2] □□ ⊕⊕ ★★★ EPIs are important players for economic growth. Deep decarbonisation of EPI through radical innovation is consistent with well below 2C scenario Wesseling, J.H., S. Lechtenböhmer, M. Åhman, L.J. Nilsson, E. Worrell, L. Coenen (2017) , Åhman M et al 2016, Denis-Ryan A et al 2016	(+2) Imposed \$
Residential	Behaviorial response	Saving energy, Improvement in Energy efficiency (7.3, 7a, 7b)	Progressively improve resource efficiency (8.4)	Animal we car 2015, Demosryali A et al 2016 Innovation and new infrastructure (9.2,9.4,9.5)
		Lifestyle change measures and adoption behavior affect residential energy use and implementation of efficient technologies as residential HVAC systems. Also social influence can drive energy savings in users exposed to energy consumption feedback. Effect of autonomous motivation on energy savings behaviour is greater than that of other more established predictors such as intentions, subjective norms, perceived behavioural control and past behaviour. Use of a hybrid engineering approach using social psychology and economic behaviour models are suggested for Residential peak electricity demand response. However, some take back in energy savings can happen due to rebound effect unless managed appropriately or accounted for welfare improvement. Adjusting Thermostat helps in saving energy. [r2] Ca Image and the set of the s	Adoption of smart meter and smart grid following community based social marketing help in infrastructure expansion Anda et al 2014
	Accelerating energy	Increase in energy savings (7.3)	Employment Opportunities (8.2/8.3/8.5/8.6) / Strong Financial Institutions (8.10)	Urban Environmental Sustainability (11.3/11.6, 11.b,11.c)
	efficiency improvement	[+2] LICICI 0+0+0 ★★★ There is high ascement among researchers based on large number of ovidence across various countries that energy efficiency improvement reduce energy consumption and hence lead to energy savings. Efficient cookstove saves bioenergy. Efficient cookstove saves bioenergy.	[42-1] IIII 6 ★★ Deploying renewables and energy-efficient technologies, when combined with other targeted monetary and fiscal policies, can help spur innovation and reinforce local, regional, and national industrial and employment objectives. Gross employment effects seem likely to be positive; however, uncertainty remains regarding the net employment effects due to several uncertainties surrounding macro-economic feedback loops playing out at the global level. Moreover, the distributional effects experienced by individual actors may vary significantly. Strategic measures may need to be taken to ensure that a large-scale switch to renewable energy minimizes any negative impacts or those currently engaged in the business of fossil fuels (e.g., government support could help businesses re-tool and workers re-train). To support clean energy and energy efficiency efforts, strengthened financial institutions in developing country communities are necessary for providing capital, credit, and insurance to local enterpreneurs attempting to enact change. (Quote from McColum et al., in review)	↑ ↑ [+2] LDLD ●●● ★★★★ Renewable encry technologies and encry-efficient train infrastructure solutions (e.g., public transit) can also promote urban environmental sustainability by improving air quality and reducing noise. Efficient transportation technologies and powered by renewably-based energy carriers will be a key building block of any sustainabile transport system. Quote from McCollum et al., in review), Green buildings help in sutainable construction.
